

## **ABSTRACT OF THE DISCLOSURE**

A storage hub is described for the temporary storage of a cap of the type typically threaded onto the outlet of a spigot to prevent leakage. The hub comprises a generally U-shaped body that can be mounted on the valve stem of a spigot, on top of the handle.

- 5 Alternatively, it can be mounted on the wall of the structure on which the spigot is mounted. The hub has a generally cylindrical body provided with external threads onto which the cap is threaded. Several means are described for securing the hub to the spigot or to the adjoining wall structure. Among them is the use of magnetic attraction, a suitable adhesive, a nail, or a threaded fastener. An alternative is for the hub and the
- 10 valve handle to be a unitary structure. The hub can be made from a polymer, an elastomer or metal.
